

WorkNex AI

Smart Workforce Management System — Final Year Project
Demo Script

Presented by Tayyab Basharat

Supervised by Dr. Huma

Built for DHA Suffa University

1. Opening — What to Say First

SAY THIS

*Good [morning/afternoon] everyone. Thank you for the opportunity to present our Final Year Project — WorkNex AI, a smart workforce management system. Before I begin, I'd like to thank our supervisor, **Dr. Huma**, for her guidance throughout the research and development of this project, and our Registrar, whose feedback during our early pitch gave us the missing pieces we needed to shape this system around Suffa's real requirements.*

2. The Problem — In Plain Words

Every university and organization struggles with the same everyday HR headache: attendance is tracked manually or on disconnected systems, leave requests get lost in emails or WhatsApp messages, and nobody can tell in advance which employees are at risk of leaving or which departments are heading toward a staffing shortage — until it's already a problem.

SAY THIS

HR teams today are reactive, not proactive. They find out about a resignation after it happens, not before. They approve leave manually, one email at a time, with no consistent policy enforcement. WorkNex AI was built to change that.

3. Our Journey

Early in this project, we pitched our initial idea to our **Registrar**. That meeting was a turning point — the feedback we received highlighted gaps in our original plan and pointed us toward what a real university HR office actually needs day to day. Combined with the continuous mentorship of **Dr. Huma**, that feedback shaped WorkNex AI from a classroom prototype into a system built to genuinely solve Suffa's workforce management problem.

4. Live Demo Walkthrough — What We'll Show

Keep each step short — narrate what's happening on screen in plain language, not technical terms.

Step A — Setting up an Organization

- 1 **Register a new organization** — a four-step guided sign-up: enter details, verify your email with a one-time code, choose a plan, and you're automatically logged in.

SAY THIS

No manual setup by IT — any institution can sign itself up and start using the system in minutes.

- 2 **Add departments** — e.g. Computer Science, Administration, Examinations.

- 3 **Add users** — employees, managers, and admins, each assigned a role and department.

Step B — Leave Management

- 1 **Configure leave policies** — e.g. Casual Leave (CL) and Earned/Annual Leave (EL), with quotas, auto-approval limits, and approval rules — all set from a simple form, no technical file needed.

- 2 **Employee applies for leave** — a short CL request within policy limits gets **auto-approved instantly** by the system.

- 3 **Emergency leave** — when an employee has an urgent, unplanned need and isn't within their normal balance, the system doesn't just reject it — it routes the request straight to an admin as an emergency advance, deducting it automatically once approved.

SAY THIS

This isn't just a form that stores requests — it's a decision engine. It reads the organization's own policy and decides, instantly, whether a request should auto-approve, go to a manager, or go straight to an admin — exactly the way a real HR policy would.

Step C — AI-Powered Intelligence

- 1 **Attrition Risk** — real machine learning models (not guesses) analyze attendance, leave patterns, and performance to flag which employees show early signs of disengagement, so managers can step in before it's too late.
-

- 2 **Leave Forecast** — predicts how many people are likely to be on leave on any given day over the next month, so departments can plan staffing ahead of time.
-
- 3 **ETL Pipeline** — behind the scenes, the system automatically processes attendance, leave, and performance data every night to keep all of this intelligence current.

Step D — Reporting & Admin Tools

- 1 **Power BI integration** — live workforce data can be pushed straight into Power BI for custom dashboards and reports.
-
- 2 **Audit Logs** — every important action in the system is recorded for accountability.
-
- 3 **Organization Settings** — working hours, timezone, and automation rules are all configurable per organization.
-
- 4 **Dark & Light themes** — a modern interface that adapts to how the user prefers to work.

5. Selling Points

Real AI, not rule-of-thumb

Actual trained machine learning models for attrition risk and leave forecasting — not static if-else guesses.

Policy-driven automation

Leave requests are evaluated against real organizational policy and routed automatically — auto-approve, manager review, or admin review.

Built for a real client

Shaped directly by feedback from Suffa's own Registrar — not a theoretical exercise, a system meant to be actually used.

Self-serve onboarding

Any organization can register itself, verify, choose a plan, and start working — no manual backend setup.

Enterprise-grade reporting

Native Power BI integration for dashboards leadership already knows how to use.

Modern, accessible interface

A clean, professional UI with full dark and light theme support — built to feel like a product people would pay for.

6. Pitch Line — Pick One (or use all three)

OPTION 1 — SHORT & PUNCHY

"WorkNex AI: HR that thinks ahead, not just keeps records."

OPTION 2 — OUTCOME-FOCUSED

"From attendance to attrition — one platform that predicts problems before they cost you people."

OPTION 3 — STORY-DRIVEN

"Built with Suffa, for Suffa — a real HR system, shaped by real feedback, solving a real problem."

7. Closing

SAY THIS

That's WorkNex AI — a complete, intelligent workforce management platform built from real feedback and real requirements. We'd like to thank Dr. Huma for her guidance

throughout this project, and our Registrar for the direction that shaped it into something Suffa can genuinely use. We're happy to answer any questions.
